

INFORMED CONSENT FOR OUT PATIENT DEPARTMENT

Patient Name : B. chandra Jetka

Age : 28

UMR No. : 21877

Ward No. :

Sex : Female

I.P. No.

Room No. :

Permission is hereby granted to the physician and other professional to provide routine medical care for the above named patient, including assessment, diagnostic testing and rendering treatment.

I hereby certify that I have read or have had explained to me the above permission and acknowledgment statements.

Patient / Legal Representative :

Name :

Relation :

Signature :

Date & Time : 11/3/23

Signature of Doctor :

Left Breast Lump

? Phyllodes
? Giant fibroadenoma

Initial Assessment by Doctors

1. Complaints:

do left breast lump ↑ size × 6 months
Right breast smaller lump.

USG Breast

19/7/2022
(continental)

2. History of present illness:

23/07/2022

Excision done.

3. History of past illness:

(23/7/22) HPE = Benign fibro epithelial Tumor.
Lump - left Breast

4. Symptoms:

New, again size ↑.

5. Duration:

USG (9/10/2023)

left Breast
B_{IV}a.

? Phyllodes / ? atypical fibroadenoma
7.5 x 3.6 cms
internal vascularity.

6. Previous Treatment:

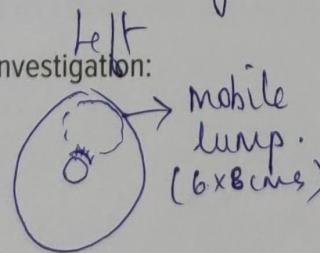

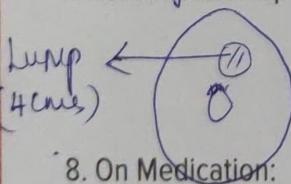

Right - multiple (4 in no) small fibroadenoma

~~o/E~~

Age / Gender : 28 Y(s) / Female	Ref By : Dr.MOHANA VAMSY. CH Sur MS, DM
Bill Dt : 11-Mar-2023 09:50 AM	Admn/UMR No : BILB15690 / UMRB2477

MRI BREAST WITH DYNAMIC CONTRASTTechnique

MRI scan of Breast performed on 3 Tesla digital MRI scanner with IV contrast.

Findings

Left breast:

There is large lobulated altered signal intensity mass noted in upper inner quadrant measuring 60x45x38 mm(APXTRXCC). Lesion shows T1 hypointense, T2/STIR hyperintense signal and smooth T2 hypointense wall. On contrast lesion shows intense persistent predominantly homogenous enhancement.Lesion shows Type II enhancement curve.

Multiple similar morphology nodular lesions noted in the upper outer, central quadrant and inner lower and outer lower quadrants, largest measures 26x20 mm between 3 to 4 'O clock position.

No evidence of skin thickening, nipple retraction.

Small volume left axillary lymphnodes with preserved fatty hilum.

Right breast:

There is large lobulated altered signal intensity mass noted in upper inner quadrant measuring 40x32x34 mm(APXTRXCC). Lesion shows T1 hypointense, T2/STIR hyperintense signal and smooth T2 hypointense wall. On contrast lesion shows intense persistent predominantly homogenous enhancement.Lesion shows Type II enhancement curve.

There are multiple small similar morphology nodular lesions in inner lower and upper outer quadrants, largest measures 8 mm at 10'0 clock position.

Small volume right axillary lymphnodes with preserved fatty hilum.

Mild perilesional inflammation changes noted in both breasts (Lt>Rt).

IP/UMR:B15862/B2477

HISTO. NO : G573 / 23

HISTOPATHOLOGY REPORT

HISTORY:

C/o. Bilateral breast lumps.

MRI – Multiple lobulated lesions with thin wall and progressive persistent enhancement in both breast (Lt > Rt) BIRADS III / IVA.

SPECIMEN:

U/S Guided Biopsy – Right Breast Lump.

GROSS :

Received six linear grey white soft tissue bits ranging from 0.2 to 1.0 cm.

Entire Tissue is Processed.

MICROSCOPIC EXAMINATION:

Sections show fragments with stretched out ducts lined by bilayer of cells with surrounding stroma which is cellular and shows periductular accentuation of cellularity. Stromal over growth also noted. Stromal cells are elongated with oval nuclei, small nucleoli and moderate amount of eosinophilic cytoplasm. Mitosis increased around 5-6/10HPF. Area of myxoid change also noted.

IMPRESSION:

SUGGESTIVE OF PHYLLODES TUMOR ? INTERMEDIATE GRADE.

Suggest Excision for confirmation.
